### NIST write up

The National Institute of Standards and Technology (NIST) framework is a government created cybersecurity infrastructure that is meant to produce a simple way to protect your network from data breaches. The NIST set standards/guidelines for these companies to follow to prevent those data breaches. The NIST framework can benefit these organizations by using these set standards/guidelines in their company. They're many different types of publications and not every company needs the same security, so these companies can manifest the NIST framework that best fits what their needs are. How can I use NIST at my future workplace? I can use it by learning all the different types of publications and how I can implement it into our company and secure our network in the best way.
