The summary of the article "Social Cybersecurity: An Emerging National Security Requirement" by Lt. Col. David M. Beskow and Dr. Kathleen M. Carley on how relevant it is for modern national security, discusses the important and changing field of social cybersecurity. Social cybersecurity is a research field that basically focuses on knowing and predicting how cyber-mediated situations can have an impact on human behavior, social structures, and political consequences. It also means building cyber-infrastructure that will allow society to stay strong against fraud and inaccurate data. The article also indicates how advances in tech have allowed both governments as well as outside organizations to affect the viewpoint from the public and control the "marketplace of ideas" at an urgent and huge size, changing whatever data environment and changing the focal point that causes the trouble. They say that national security in the digital era depends on handling these cyber-mediated risks as information warfare is now a major weapon of ability.
