

Class Overview

Jack Hinkle

Cellular Biology has been an extremely interesting and informative class which has taught me many interesting things related to my major. As a biology major and an aspiring aquatic veterinarian, one of the most interesting things to me has been the causes and effects of mutations within the cell. This new understanding of the effects of genetics and epigenetics has also been influential in helping me understand the full impact of the genetics course which I took last semester. Cellular Biology has also helped push me to form a more set schedule for my schoolwork and free time. Studying for tests in this class often takes a non-insignificant amount of time and in combination with the other classes which I'm taking it has caused me to need a more definite schedule for my schoolwork.
