Reflection Essay 1

The first time we communicated was through emails, and then decided on setting up a group chat. A couple days later, we first communicated as a group when I established a group chat on the Microsoft owned app, GroupMe. GroupMe is a messaging app that allows users to create group chats with others who have the app and allows users to text through the app or through their phones messaging system. Once the group chat was established, we began pitching ideas as to what our innovation was going to be. I originally proposed something that could help businesses detect vulnerabilities in their systems and networks. Fenton then added that what I proposed would be able to generate a report which would show what vulnerabilities and attacks were present in the businesses systems and network. Madelene then pitched that what Fenton and I had proposed could be a software that would be easy to use for businesses and organizations. After some discussion in the group chat, we agreed to combine our ideas, and reached a decision on our innovation, which would be a software that can detect vulnerabilities in a system and network, recognize what threats are present, and determine if an attack is currently taking place. The software would then generate a report listing what vulnerabilities are present and how to remedy them.
