

CYSE 270: Linux System for Cybersecurity

Lab 8 – Shell Scripting

(Total 100 Points)

Please refer to the slides for **week 8 - Shell scripting** and write shell scripts to complete the following tasks. **Submit the screenshot for the script and its output, both.**

NOTE: Please replace the name of the script with the name you used for the script. In the sample screenshot, I have used those names to create my script.

Step-1: Use vi or nano editor to write your script (Ex, **vi YourScriptName.sh**) for the following tasks.

```
└─(adan㉿kali)-[~/Desktop]
$ vi scriptromero.sh

└─(adan㉿kali)-[~/Desktop]
$ █
```

Step-2: After saving the script, **save and exit out of the editor** and make the script executable by adding execute permission (**chmod +x YourScriptName.sh**)

```
└─(adan㉿kali)-[~/Desktop]
$ chmod +x scriptromero.sh

└─(adan㉿kali)-[~/Desktop]
$ █
```

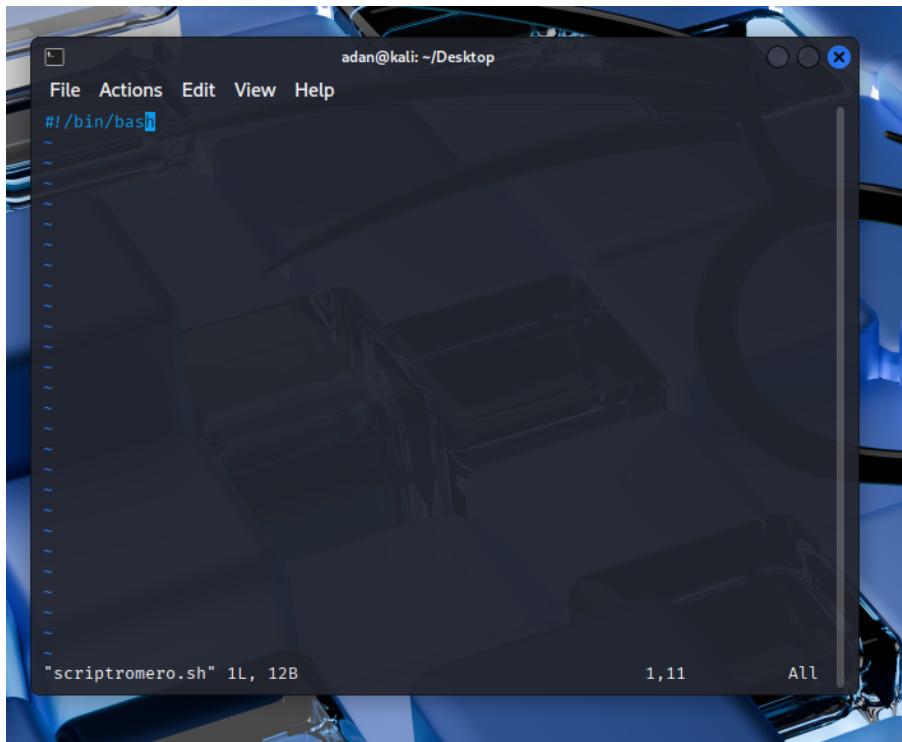

Step-3: Run your script using **./YourScriptName.sh**

```
└─(adan㉿kali)-[~/Desktop]
$ ./scriptromero.sh
```

Task A (Correct script (25 points) + result/output after executing the script (25 points)- Conditional Statement

Write a shell script using nano or vi editor (eg, vi scriptname.sh) like below, that performs the following task:

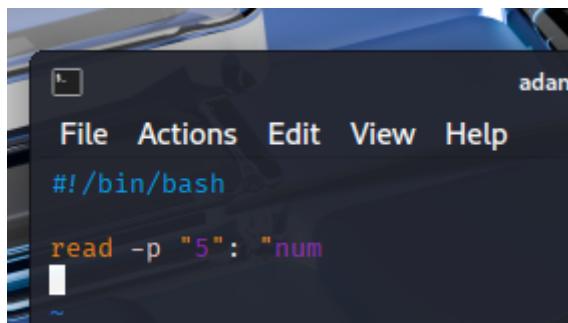

1. Add the **Shebang** (#!/bin/bash) as the first line in your script.

Terminal window showing a blank script file named "scriptromero.sh". The file contains the shebang line "#!/bin/bash". The status bar at the bottom indicates 1L, 12B.

```
#!/bin/bash
```

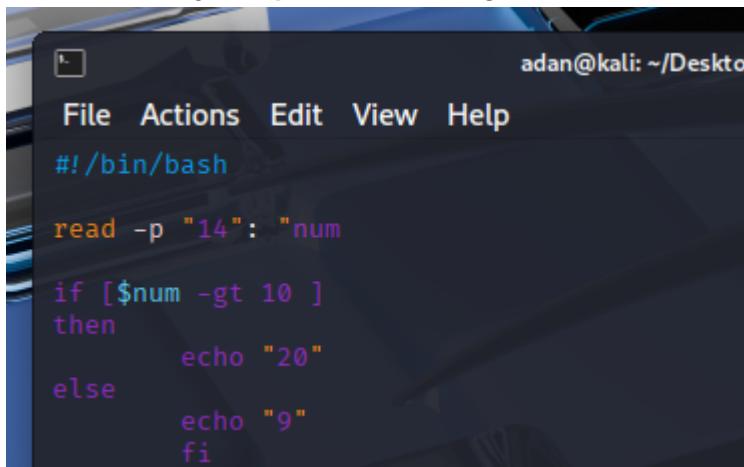

2. **Read** a number using **read** function

Terminal window showing the "read" command being typed. The command is "read -p "5": "num".

```
#!/bin/bash
read -p "5": "num"
```

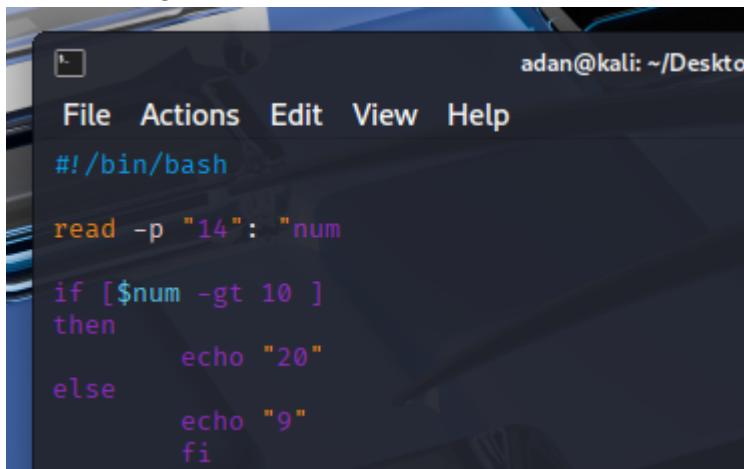

3. Using **if statement**, check if the input number is greater than 10, then print the message "**Input number is greater than 10**".

Terminal window showing a script with an if statement. The script reads a number from the user and then checks if it is greater than 10. If it is, it prints "20"; otherwise, it prints "9".

```
#!/bin/bash
read -p "14": "num"
if [ $num -gt 10 ]
then
    echo "20"
else
    echo "9"
fi
```

4. If the number is not greater than 10, then print the message, “**Input number is not greater than 10**”.

The image shows a terminal window with a dark blue background. The title bar reads "adan@kali: ~/Desktop". The menu bar includes "File", "Actions", "Edit", "View", and "Help". The main area of the terminal contains the following bash script:

```
#!/bin/bash

read -p "14": "num"

if [$num -gt 10 ]
then
    echo "20"
else
    echo "9"
fi
```

(Your script should result into the output similar to this sample screenshot after executing as shown below)

```

└─(cyse270㉿CYSE270)-[ ~]
└─$ ./TaskA.sh
Enter the number to check:
9
Input number is not greater than 10.

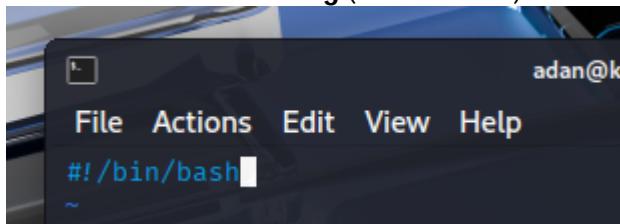

└─(cyse270㉿CYSE270)-[ ~]
└─$ ./TaskA.sh
Enter the number to check:
11
Input number is greater than 10.

```

Task B (Correct script (25 points) + result/output after executing the script (25 points) - Shell Script to Create a new file

Write a shell script using nano or vi editor (eg, nano scriptname.sh) like below, that performs the following task:

1. Add the **Shebang** (`#!/bin/bash`) as the first line in your script.

```

adán@kali: ~
File Actions Edit View Help
#!/bin/bash
~
```

2. **Reads** the **name** of the file to check for a filename that exists.

```

(adán@kali)-[~/Desktop]
└─$ ./taskb.sh
zsh: permission denied: ./taskb.sh
```

3. Check whether the given input is a directory or regular file.
4. If the input is a directory and exists, then display the message “**Directory exists**”.
5. If the input is a regular file, then display the message “**It is a regular file, and the file exists**” and display the contents of the file.
6. **If the given input name in step-1 doesn't exist**, then create the new file with the given

name in step-1.

(Extra credit: 10 points) Add your name to the file (using redirection operator ‘>’) and display the contents for the newly created file.

7. Save and exit the editor and remember to make the script executable using the command **chmod +x scriptname.sh**)

(Your script should result into the output similar to this sample screenshot after executing as shown below)

```
└─(cyse270㉿CYSE270)-[~/Desktop]
└─$ ./TaskB_withExtra.sh
Enter the filename to check:
test.txt
It is a regular file, and the file exists
└─(cyse270㉿CYSE270)-[~/Desktop]
└─$ ./TaskB_withExtra.sh
Enter the filename to check:
lab8_example.txt
It is a regular file, and the file exists
The contents of the file are:
Mohammed Al kinoon!
```

Extra Credit (15 points)- Check Directory

Write a script like below that

1. Reads Two variables- your name and the name of the directory as input.
2. Your script should check for the validity of the given directory name, if the entered filename is a directory, then display its contents
3. If the directory doesn't exist, then print an error message "Sorry, the entered directory name is not a valid directory name."
4. You need to execute your script and test the following directories to test with your script
 - /etc/systemd
 - /home
 - A directory that does not exist

Display the contents for the directories you have entered

(See the screenshot below where the script has been executed 3 times to check for the Three different directory names as the test input)

```
(cyse270@CYSE270)-[~/Desktop]
$ ./lab8_extra_credit.sh
Enter your name:
Mohammed
Enter the directory name to check:
/etc/systemd
Hello, Mohammed. The contents of the directory '/etc/systemd' are:
journald.conf logind.conf network networkd.conf pstore.conf sleep.conf system system.conf timesyncd.conf user user.conf
```

```
(cyse270@CYSE270)-[~/Desktop]
$ ./lab8_extra_credit.sh
Enter your name:
Mohammed
Enter the directory name to check:
/home
Hello, Mohammed. The contents of the directory '/home' are:
bob cyse270 data julia susan
```

```
└─(cyse270㉿CYSE270)-[~/Desktop]
└─$ ./lab8_extra_credit.sh
Enter your name:
Mohammed
Enter the directory name to check:
/fake_directory
Sorry, the entered directory name is not a valid directory name.
```
