

Review the NICE Workforce Framework. Are there certain areas that you would want to focus your career on? Explain which areas would appeal the most to you and which would appeal the least.

The career I am interested in going into is cloud architecture. Cloud architects focus on everything that deals with the cloud. They design the cloud, they create space on the internet, and more. In the category analyze; the specialty areas that would apply are all source analysis, language analysis and targets. All source analysis generally is gathering information and putting it into its right place. Language analysis is generally being able to understand complex information. Targets are just applying the knowledge you know to the area you need it in your career. The knowledge you need to have is website manufacturing, identifying what is wrong with networks and being able to fix it which goes into cyberthreats and attacks. In collecting and operating the specialty area that would apply to my career is cyber operational planning. With this they protect systems from cyberattacks and come up with plans to help go against threats. Also, also gather information to protect the systems they are operating on. In the category of operation and maintenance it is mainly about the administration aspect. It will be more in charge of compiling data and keeping it organized and safe. It goes with my career path also because it involves high levels of programming, finding errors in simple data mistakes. All the areas above would appeal the most. The ones that would appeal the least are to oversee and govern. It will appeal the least because it has more to do with overseeing and policies instead of programming and network work management.
