Journal Entry 5

1. I believe the most sense motive is for money. I think this is the most common motive because a lot of cybercrimes has to do with a financial gain. I also believe it's the easiest way to get money and the crimes are organized to ensure the profit is received.
2. I believe the second motive would be political. Especially in this time period I feel those who would commit a cybercrime would be based on their ideology. Based on the first article I read the number of cybercrimes within 2025 explains how common political motives are.
3. The third most logical motive I think is revenge. I think revenge threats is a pretty common threat and usually are insider threats within a group. I also believe those who have this motive think they can benefit from doing this to get what they want.
4. The fourth most logical motive is recognition. I believe people who do this think they have a high ego and want a reputation in the cyber world.
5. I think the fifth motive would be entertainment. I believe those that think cybercrimes are entertaining is done out of excitement or find it thrilling. I also believe these types of crimes are not as common or severe.
6. The sixth motive I believe is logical is boredom. I believe that entertainment and boredom cybercrimes are quite similar. I also think that boredom isn't a typical cybercrime and the offenders tend to be younger individuals.

7. I believe the seventh motive is curiosity. After reading the article I think this motive is done by younger individuals with no experience in cybercrimes. I also believe this motive is done to maybe learn more on how to commit crimes and see if they're successful.
8. The last motive I believe makes the least sense is for multiple reasons. This can range to a multitude of threats. Understandably it can be multiple reasons for one attack however, I believe most cybercrimes are done for one specific reason.
