“When having a public account leads to a stolen account”

In this photo the individual is viewing her social media account which seems to be public but got hacked. A lot of individuals have public social media accounts, and this allows everybody to view their personal information which is usually used for passwords. This shows how important it is for humans to practice common security protocols and not post important information online.

“Wow, all these people just freely connected to my WIFI”

This photo shows a man being able to view those connecting to “free WIFI” but in reality, he is the one who created this and has the control. This shows how humans are quick to be misled from what appears to be something normal. It’s important that individuals are aware and practice smart security choices when connecting to public WIFI.

“When I’m protected by my two-factor authentication”

This photo shows a woman happy after knowing her two-factor authentication works and keeps her account protected from hackers. Two-factor authentication is a security process that confirms your identity after providing your password. This is a great way for individuals to stay protected from malicious attacks, as most of the time the authentication is biometrics which requires the correct individuals fingerprint or facial recognition.
