

The First 50 Hours: Tutorial Videos and Speaker Applications

Reflection #1

Bailey Williams

The first 50 hours of my internship have been primarily focused on creating tutorial videos for the product website. My portion of the videos has been focused on demonstrating how WhiteRabbitNeo, an uncensored, open-source, red-team AI model, can help automate different cybersecurity tasks. I also created a video series about configuring and utilizing Kindo's AI models with the Continue extension in VS Code and JetBrains. These videos have been uploaded to Kindo's YouTube, as well as on the product as in-application training videos. One of my videos was also shared on Kindo's LinkedIn, and I've attached an image of the post below. The most challenging aspects of creating these tutorials were coming up with different applications and recording the voiceovers.

If you're in cybersecurity and you feel like you can leverage AI to help you, this is a great primer from www.kindo.ai cybersecurity intern [Bailey Williams](#) on how to do so!

Aside from the tutorial videos, I have also been working on submitting Call for Papers (CFPs) for different cybersecurity conferences. So far, I have only applied to PDX BSides in Portland, Oregon, but I will be applying to more conferences in the coming weeks. My manager has also requested for me to attend Chicago BSides in November, so I have begun planning for that trip.

The primary challenge of the first 50 hours of my internship has been to balance working part-time alongside a full course load. One thing I did to make this easier was to dedicate a specific day each week to work through the majority of my internship tasks, rather than trying to do everything each day.

In conclusion, while it has been a challenge to adjust to working part-time and being a full-time student, the experience has been rewarding and I feel like I am learning a lot about conveying different cybersecurity concepts in a way that is easy for people to understand, both in the tutorial videos and the CFPs.
