

**Watch this video and describe, What ethical questions did the presentation raise for you?
How do you think society should address these ethical concerns?**

In my opinion, the main topic of the video was the idea that Artificial Intelligence is only as good as the data that it is fed. This can lead to a number of concerns from different sides of the AI use spectrum. On one side, the average person may use AI, knowingly or unknowingly, while searching for information and like the presenter in the video said, if the initial data is wrong, it's outcome will be wrong as well. Especially in cases where the user may not realize that what they are seeing is Artificial Intelligence, this can lead to the spreading of false information. In more malicious uses of AI, cybercriminals can use it to enhance, improve, or even create different forms of malware or access information that would be blocked by more mainstream versions of AI. Another concern that I have about AI that relates to some of the topics covered in the video is the use of biased training data and the harmful outcomes that can come from it. Due to all of these reasons and many more, there should be more accessible information about how to recognize and fact check AI in order to help spread awareness. Unfortunately, imposing legal restrictions on AI may not necessarily be a possibility due to how fast advancements are being made and how slow the legal process can be. This leads me to believe that the best course of action against the more dangerous aspects of Artificial Intelligence is simply education.
