Cell Biology

12 December 2021

End of Course Reflection

Throughout this semester, I have learned the importance of Cell Biology. I had a broad understanding of cells and their importance but what I didn't know was the depth of the knowledge and how Cell biology is everything to how humans and every other living organism work. Cell biologists working in animal, plant, and medical research will be able to generate stronger vaccines, more effective medications, better-quality plants, and a greater understanding of how all living things survive by better comprehending how cells behave in good and pathological situations. This class has definitely broaden my knowledge and allowed me to consider a career in research. I honestly think cell biology should be a class offered in high school. Students will be able to learn how theri body works and why certain things in the body happen,
