Reflection #3

This project impacted me by taking myself outside my comfort zone and helping others learn an important topic. Service learning is significant because it combines classroom learning to real-world experiences in the community. People that take part are more involved in their communities, obtain practical skills, develop their career and personal interests, and are generally more active citizens. People need to be active and conscious of their communities on a social level in order to help each other and be more responsible individuals. Providing possibilities for young people encourages them to participate. Finally, it instills the habit of doing something kind for others. In my group, we taught high school students about Different variants of Covid. Families around the country are adjusting to the COVID-19 pandemic's developing alterations in daily life. Most schools, public meeting places, and non-essential businesses are closed, leaving parents and other caregivers to assist their families in adjusting to the new normal. This involves seeking to keep children active, safe, and up to date on schooling as much as possible. None of this is simple, but staying focused on what is attainable helps to maintain a sense of control and reassure youngsters that they are OK and that things will improve. It impacted the students by giving them a better understanding of where this virus came from and how it works. It shows the importance of knowing why covid is very dangerous and why it should be taken seriously.

Taking Genetics while researching this topic has shown me how genetics plays a huge role in viruses and how they can mutate into different viruses that can potentially be more dangerous.
