1. Fix the bug in the script files to load LHOST automatically. You should not hard code the IP in the script file.

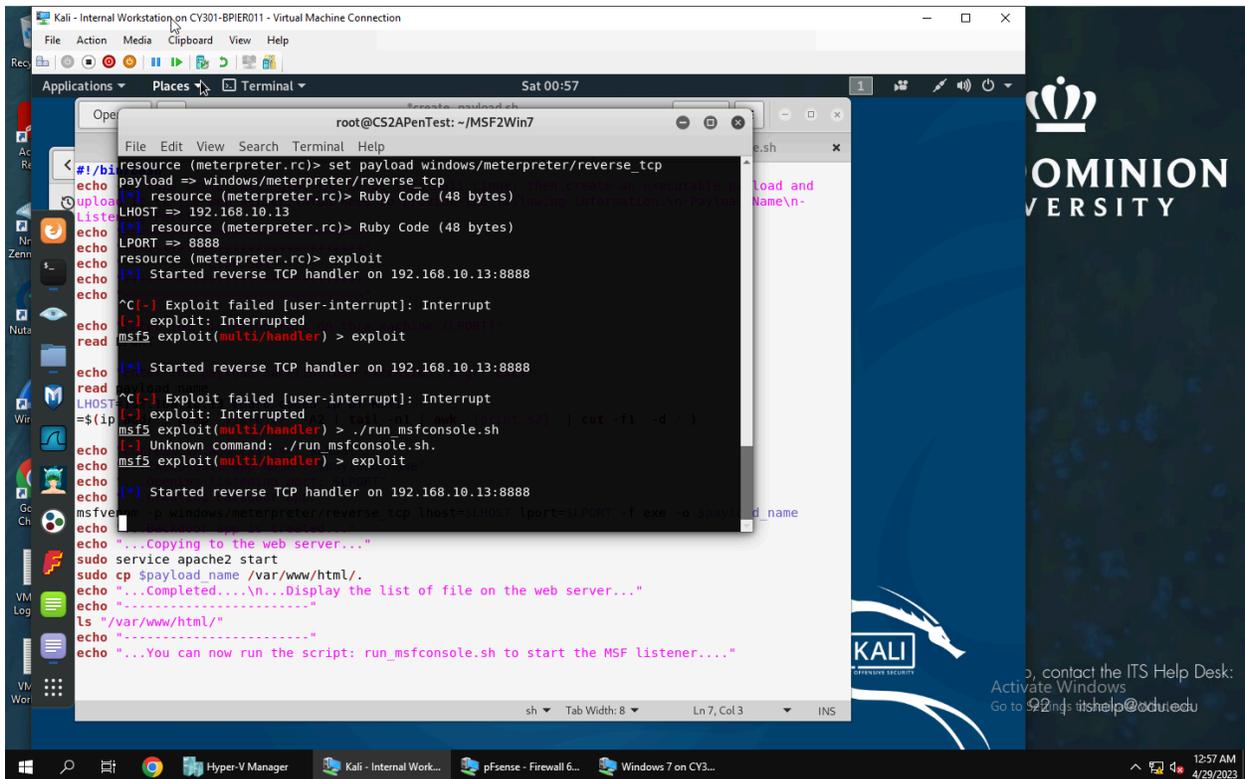

In this screenshot, I made the script files load the LHOST automatically by putting the input “hard code the LHOST”.

2. Use the script to successfully set up reverse shell connection to the target Windows XP and Windows 7.

In this screenshot, I was able to set up the reverse connection to Windows XP

In the screenshot above was my attempt at running the msfconsole.sh in Windows 7 and was successful up until the point where the reverse TCP exploit started. The reverse TCP connection was taking rather long, and not going back to the meterpreter command line.
