#### Journal Entry 4

Maslow's Hierarchy of Needs is applicable to technology, since online experiences frequently satisfy different tiers of human requirements. At a fundamental physiological level, technology offers tools for food delivery, medical services, and sleep monitoring, thereby guaranteeing our physical demands are satisfied effectively. Technology provides improved safety via secure connections and technologies such as antivirus software and home security systems. Online communication platforms, messaging applications, and online groups satisfy belonging demands by facilitating relationships with others and promoting a sense of social inclusion. The need for respect is fulfilled through digital platforms where individuals pursue validation through likes, followers, and online acknowledgment. Ultimately, achieving one's goal is attained by educational platforms, creative expression in digital media, and avenues for personal development through virtual experiences, including skill enhancement applications. Every tier of Maslow's structure has a digital equivalent that influences individual and societal experiences in the modern technologically driven landscape.
