Exploiting software with the intentions of making the software stronger for companies or people.

Creating hardware that runs diagnostics on your computer.

University degree in cybersecurity.

Reviewing cybersecurity policies for companies or businesses.

Incident response for companies.

Tutoring/Teaching students or those interested in pursuing a career in cybersecurity.

Yacht computer system that's secure.

Business plan: My business plan is for the tutoring/teaching business. Tutoring cybersecurity is something I can currently make a business out of in college. First, I would establish some sort of social media presence to broaden my tutoring opportunities. Along with the social media presence, I would create a website that provides all the information on my tutoring, how much it costs, and my availability. My tutoring would include on campus sessions, however, most of my clients will get their tutoring sessions online through video chatting with me. Also, I would include videos lectures that clients can purchase for a lower price than my regular tutoring. Next,

after i've been tutoring for a while, i'm comfortable with how the cybersecurity tutoring business is running, and i've made a decent amount of money, I would then branch out and recruit more tutors. These new tutors would help me reach more clients than I could on my own, but I would only pay my tutors a certain percentage of their client's payments. Lastly, I will finalize my business plan with adding different tutoring packages. These packages would be the best way for my clients to get the most out of their money. All in all, my cybersecurity business would be mostly for the benefit of helping my clients learn.
