

Journal Entry 10:

While reading the article it is interesting to see how much of it focuses on the aspect of Russia and the United States. Understandable with the aspect that we have never truly been allies with Russia, but it is interesting that we also don't discuss what our other adversaries do, such as China and their probing and hacking attacks. I did like the fact that they have brought up a new upcoming form of social cybersecurity such as AI and bots. What seems to be advancing is the need for less and less human offensive as it is for one human to control multiple bots that can target hundreds of potential targets. It is interesting to see though how the article does talk about how countries are starting to fight in these cyber wars more than physical and how the public does not even know they are in casualties of these wars. When you think of cyberattacks, you only think of hacking into government computers or getting leaked plans through servers, but not many outside the cybersecurity field see the phishing, quid pro quo, or the deep fakes as attacks that our adversaries can use against us.
