Journal Entry 15

When I look at how the speaker's pathway to his career is interesting. From starting out as an accountant to going into Cyber Forensics. When he started out, he was interested in an IT job that opened in his firm. This I feel is where most start out in the cybersecurity field. To learn the basics of the career without diving headfirst into cybersecurity. This helps most learn their way around a computer without having the stress of trying to protect multiple high-risk servers with little experience or not knowing how computers work. Once he gained the experience and was hired into a larger firm. This is where he was able to put his skills to the test. Being able to navigate and eventually taking on his role as cyber forensics and successfully detecting and deter threats. I feel that if he was just thrown into this field with little experience, he would have not been as successful as he talks about in the video.
