

I admire the speaker's pathway to his career because of the way he went off on a limb to get into the field of digital forensics. A lot of cybersecurity professionals get into their careers by getting into companies on the ground level, and gaining experience as they move up. His passion for technological and forensic fields is what helped him to learn more about the career and, went from being an IT assistant on the side at his accounting job to becoming a lead digital forensic analyst. In today's world careers are often made by people taking any and every opportunity they get. The speaker gives the credit of his career flourishing from him taking his chance to work at an up-and-coming digital forensics lab and used it to his advantage.
