Professor Karahan

Cyber Security Internship

Journal 5

In my second to last set of 50 hours, I have made tremendous strides. I am almost

fluently understanding the language C# and know how to use the majority of tools in visual

studio. I have contributed a lot to the intern team and the LiveQueue project. We have met

with some of the senior devs to get us out of the areas where we were struggling and made

even more progress. The last big step in this project is to create a new controller for our

LiveQueue editor page within the CloudFit platform. This will be started in the upcoming week

by two of the other interns and myself.

I have also been working on the *On-Call* project where I implemented the add user

button. After struggling with creating the fields within the pop up, I connected with one of the

other interns how took some time to look through the code and figure it out with me. This

week, we also had another course on Kubernetes which cleared up any questions I had from

the first Kubernetes crash course that we had.

This week I also got to sit in on a very interesting meeting which discussed the new

Windows 11 that will be coming out fairly soon and all of the new features and changes that it

is bringing. Another skill that I have been growing these past few weeks has been the use of

Microsoft Sql, Docker, and PowerShell. I had some limited knowledge with powershell from my

internship last summer, however with using it daily now with the *On-Call* project and Docker, I

can say that I have more knowledge and am almost ready to claim it as a skill that I have. I am excited about the things I have learned so far and I am looking forward to the new knowledge I gain next week in my last set of 50 hours.
