

Module 2 Submission

My home network setup is pretty simple. The modem connects to the router, which then sends the internet to all my devices. These devices include a computer, a TV, a tablet, and a couple of mobile phones. This setup makes sure everything in the house can get online without any problems. The modem is what brings the internet into the house from my internet provider. The router takes that connection and shares it with all the devices. The computer is mainly used for school and web browsing, while the TV connects wirelessly to stream shows and movies. The tablet and phones use Wi-Fi for social media, browsing, and entertainment. I chose this setup because it's easy and works well for my needs. The router gives good Wi-Fi coverage, so I don't have to worry about plugging in cables for everything. It keeps all my devices connected smoothly. At some point, I might look into upgrading my network, but for now, I'm not sure what changes I would need. If I start having issues, like slow speeds or bad signals in certain areas, I'll figure out what needs improving. But right now, everything works fine for what I use it for.
