

## ODU CYSE 270 – Linux Systems for Cybersecurity

Chadwick Bennett

### Lab 1 – Install Linux VM

This lab introduced me to installing a Linux VM (Virtual Machine) using the Kail software. I learned how to set up a guest operating system, a virtual disc, and use various commands: echo, date, is, ls, and pwd.

The challenge I faced was using the correct terms and definitions. The lab helped me understand how to run in a guest or virtual terminal session that runs in an isolated environment from the main system's files or anything else using storage, which is critical in cybersecurity.
