

ODU CYSE 270 – Linux Systems for Cybersecurity

Chadwick Bennett

Lab 2 – Working with Command Line

In this lab, I became familiar with and worked using the command line. I practiced using commands: ls, cd, pwd, and other file management commands. Remembering all of the available commands and syntax was difficult.

I relied on referring to the reference slides for the information. I was also challenged by missing commands, copying directories, and creating/removing files. With additional practice, I became more comfortable with commands and files. This lab showed that having command-line skills is important for system administrators, particularly in cybersecurity.
