

ODU CYSE 270 – Linux Systems for Cybersecurity

Chadwick Bennett

Lab 4 – Group and User Management

This lab introduced user and group management. I learned how to create users, assign them to groups, and give command permissions to the users.

The challenge was trying to memorize the commands. I used search lists to recall the commands, their definitions, and what purpose they served. This lab helped me understand how to provide access to users that they need and prevent access to areas or files that they don't need. No more, no less.
