

ODU CYSE 270 – Linux Systems for Cybersecurity

Chadwick Bennett

Lab 6 – File Permissions

This lab focused on making multiple user accounts and passwords in Linux. I learned how to provide each user with different file permissions and access control.

The challenge was that I made a lot of spelling mistakes that required correcting. The lab showed me how to double-check what files users actually had access to, and which files they didn't. It also showed how the file permissions protect sensitive data and prevented unauthorized access.
