

Project Report

- **The problem statements.**

- Demonstrate your understanding of the applied aspect of Python and socket programming in your concentration.

- **The details about the hardware**

- Device name StuHpEnvy
- Processor 12th Gen Intel(R) Core(TM) i7-1255U 1.70 GHz
- Installed RAM 16.0 GB (15.7 GB usable)
- Device ID FFE4A83F-F3FE-4E6B-BA12-C20518C7D004
- Product ID 00342-22069-35905-AAOEM
- System type 64-bit operating system, x64-based processor
- Pen and touch Pen and touch support with 10 touch points
- Edition Windows 11 Home
- Version 22H2
- Installed on 11/16/2022
- OS build 22621.1555
- Experience Windows Feature Experience Pack 1000.22640.1000.0

- **Software used to implement the project**

- Python 3.11 64bit

- **The results and discussions.**

- This is a text-based game that simulates a basketball career path. It uses sockets to communicate with clients over a network connection. The game presents a series of choices to the player and responds based on their input.

- The game starts by listening for incoming connections on a specified host and port. When a client connects, it sends a welcome message asking if the player wants to play. The player can respond with "yes" or "no". If the player chooses to play, the game progresses through a series of nested loops, each representing a different decision point in the player's career.

```

- The game offers choices such as playing in college or overseas, choosing a college team, dealing with challenges like not being in the starting lineup, deciding whether to stay in college or enter the NBA draft and so on. The game responds to the player's choices with appropriate

messages. The player's career path can lead to different outcomes, such as winning a championship, getting drafted by an NBA team, graduating, or facing setbacks like injuries, arrests, or career-ending events. Upon completion, the game randomly selects a team from the list using the random function.

- Internal documentation (i.e., comments) is required.
 - It's important to note that this code only handles one client at a time, as it waits for client responses in nested loops. If multiple clients connect simultaneously, the game will handle them sequentially. To support concurrent connections, the code must be modified to handle multiple clients using threads
 - Additionally, error handling and input validation could be improved to provide a better user experience.

Appendix.
