

One way researchers may use the information presented by the website could be to estimate where future breaches may occur. For example, if a majority of attacks happen in the state of New York, researchers may prioritize protection for systems in New York. Another use that researchers may use the information presented by the website would be by figuring out what companies are being targeted. For instance, if researchers know that government organizations are being targeted by threat actors, they can add more protection to Government organizations to help prevent breaches. An added use that publicly available information about data breaches can aid researchers would be by practicing specific procedures to follow during specific data breaches. For example, if a company is hit with a DISK breach, researchers may improve or find ways that can help to protect and prevent future DISK breaches.
