

I think that the way the speaker found his career is very interesting to me. This is the case since he mentioned that he started off on the path of being an accountant, then got a position that was integrated with both the accounting and IT world. In the end, he got an offer to work as a digital forensic investigator. This drastic change in career paths shows that cybersecurity jobs and skills are needed everywhere and can come from many different directions.

The job of a digital forensic investigator relates to the social sciences by needing to understand why certain people search for topics. For example, as mentioned in the video, a digital forensic investigator may be looking for files related to death threats. By understanding why a person sent the threat, the digital forensic investigator can use the information to find when and possibly where the person made the threat in the first place.
