Journal entry #10

Social Cybersecurity

Social cybersecurity is a crucial emerging domain in national security. This article highlighted how there has been a shift from conventional warfare to information and psychological warfare. It brought up the concept of BEND forms of maneuver, to provide a valuable framework for comprehending how the flow of information can be manipulated in the cyber realm. This includes tactics like miss direction, hashtag Latching, and opinion leader co-opting. This article also touched on AI, and how prominent bits powered by AI carry out targeted actions. I think as the world progresses and as technology evolves so will the way wars evolve. Based on the things I've read I think more than ever it's important to be vigilant and have a proactive framework for national security in the cyber realm as technology advances.
