

Reflection 6

I decided to spend my final fifty hours at my internship by applying all my research on data analysis and structure into a small report for my supervisor.

As alluded to in the previous reflection, this report would focus on the newer aspects I found during my internship while explaining further details on current applications used for data sorting at the Brooks Crossing iLab. The report then focused on the data analysis methods I found that best suited the iLab's needs. I believe this report would serve as a good starting point for other interns in the future to go off of, as the data analyst position started this semester and currently has only two remote workers (me included). After conducting my analysis of the data inside the iLab, I then focused on listing potential avenues for the iLab to work towards in the future. While the iLab is an educational-based business, it is still a business.

After all of that was sorted out, I decided to spend the rest of my time at my internship by performing the methods of data sorting I found on any remaining data. Overall, my experience with this internship was very interesting. Most of my time spent has been related to cybersecurity, and as such I didn't really focus too much on data analysis. This internship gave me an alternative perspective and potential career path if I ever decide to stop pursuing cybersecurity. I believe I gained a lot of insight and perspective that I otherwise would have never gained if I had not taken this internship.
