

Our group unfortunately was not able to present our presentation. I am a little bummed that I was not able to share my enthusiasm with young high school students to get them interested in something I find interesting. Our genetics is what creates us and is the reason why we are alive. Hopefully, there will be more cool opportunities like this to share with others and open their possibilities to a career in genetics.

By creating a PowerPoint and pulling everything together, I was able to connect multiple points together and see the connection of genetic topics. By teaching something, you know it. By preparing to teach young students, I was able to learn more about genetics and solidify what I already learned from this semester.

This was the first service-learning project I have ever had to complete, however, I learned that being able to get students in my community involved with genetics is something that I want to continue to do as a career and teach students about the awesomeness of genetics.
