# TASK A

1. Use Nmap to profile the basic information about the subnet topology (including open ports information, operation systems, etc.) You need to get the service and backend software information associated with each opening port in each VM.

```
Attacker Kali - External Workstation on CS301-DSTAV002 - Virtual Machine Connection

root@CS2APenTest: # nmap 192.168.10.0/24
Starting Nmap 7.70 ( https://nmap.org ) at 2024-02-27 21:55 EST
Nmap scan report for 192.168.10.2
Host is up (0.0088s latency).
Not shown: 997 filtered ports
PORT      STATE SERVICE
53/tcp    open  domain
80/tcp    open  http
443/tcp   open  https

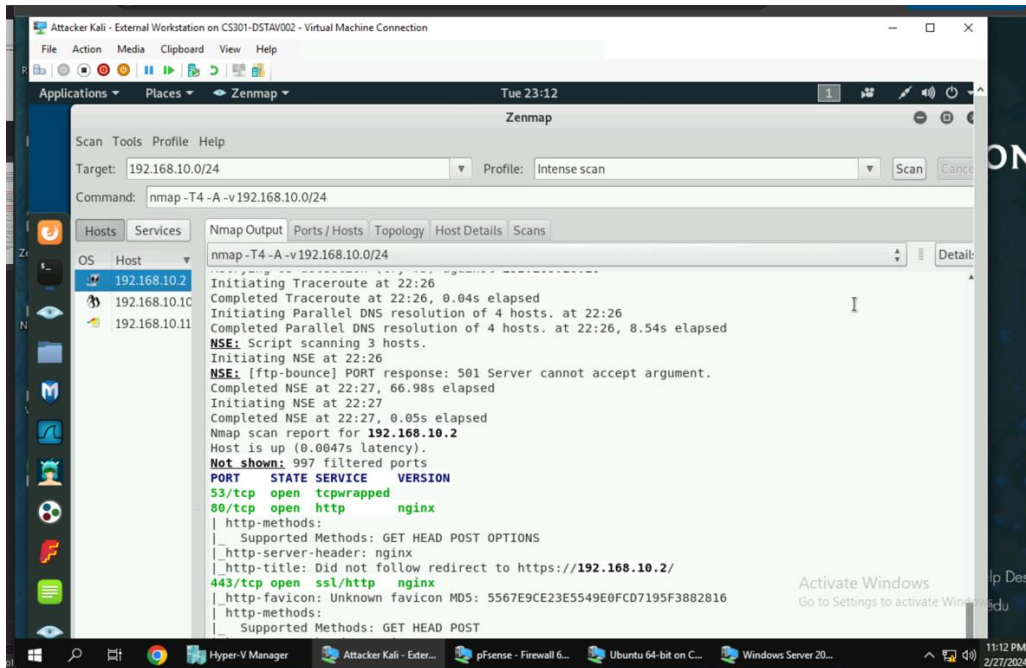

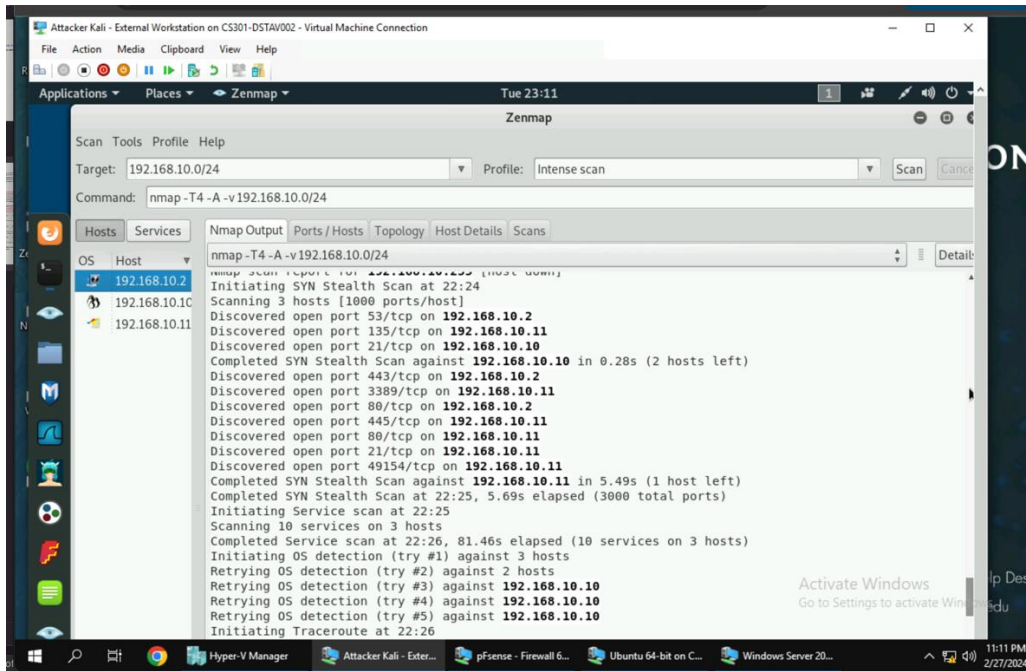

Nmap scan report for 192.168.10.10
Host is up (0.020s latency).
Not shown: 999 closed ports
PORT      STATE SERVICE
21/tcp    open  ftp

Nmap scan report for 192.168.10.11
Host is up (0.011s latency).
Not shown: 994 filtered ports
PORT      STATE SERVICE
21/tcp    open  ftp
80/tcp    open  http
135/tcp   open  msrpc
445/tcp   open  microsoft-ds
3389/tcp  open  ms-wbt-server
49154/tcp open  unknown

Nmap done: 256 IP addresses (3 hosts up) scanned in 18.07 seconds
root@CS2APenTest: #
```

In this screenshot I used the command “nmap” followed by “192.168.10.0/24” to get the basic information about the about the subnet topology.

2. Run Wireshark in Ubuntu VM while External Kali is scanning the network. Discuss the traffic pattern you observed. What do you find? Please write a 200-word essay to discuss your findings.

In my findings of the traffic pattern, you can see many requests occurring in the scan. The scan goes on for some time and gathers a long list of information. This information covers various things. There are two different scans occurring such as SYN Stealth scan and a service scan. You also see multiple IPs being scanned and reported. Many different ports or are being reported along with its host. There is also a traceroute present that shows 4 hosts. The scan becomes a lot more closely as it shows more TCP ports and where they are coming from. When you go to eth0 on Wireshark your standard information going through. However, when you scan Ubuntu on External Kali and go back to Wireshark you begin to see a pattern in the information where every other one is highlighted in red. This is an indication that someone is trying to scan your network. Making it so that your network is now vulnerable for information to be taken. You can also see from this information the protocol which is TCP and the length which is 54. This pattern keeps going continuously indicating that whoever it may that is scanning your network is scanning it.

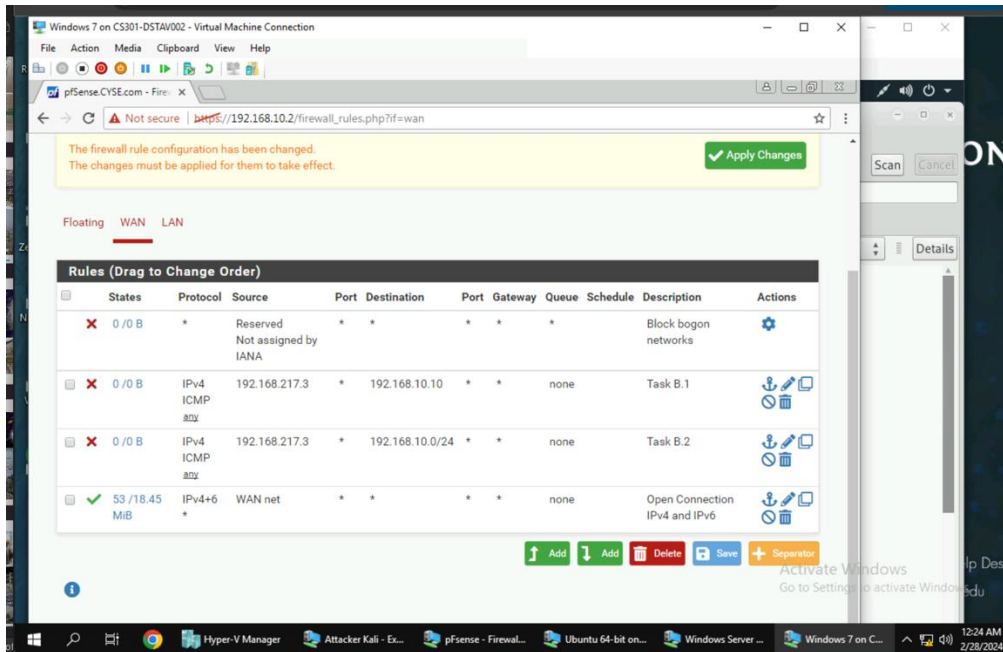

# Task B

1. Configure the pfSense firewall rule to block the ICMP traffic from External Kali to Ubuntu VM.

Rule #	Interface	Action	Source IP	Destination IP	Protocol (port # if applicable)
1	WAN	Block	192.168.217.3	192.168.10.10	ICMP

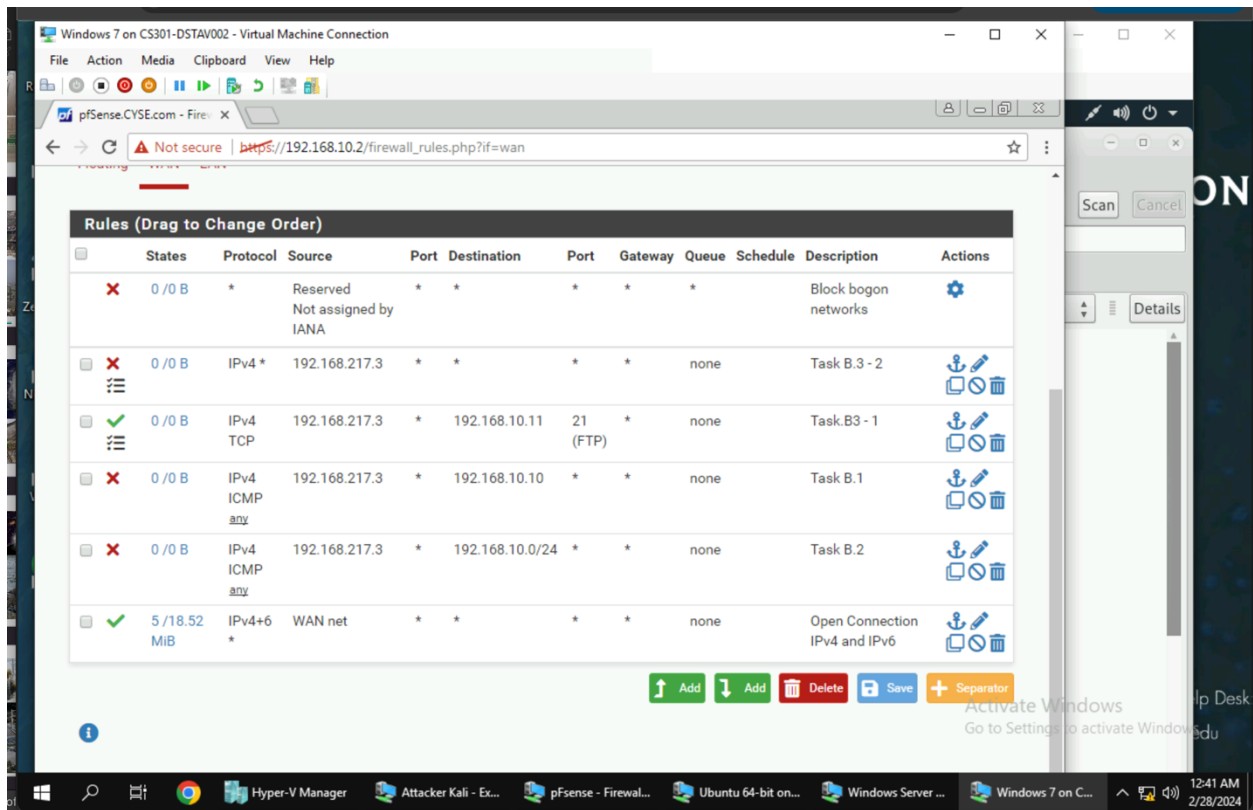

2. Clear the previous firewall policies and configure the pfSense firewall to block all ICMP traffic from External Kali to the LAN side.

Rule #	Interface	Action	Source IP	Destination IP	Protocol (port # if applicable)
1	WAN	Block	192.168.217.3	ALL (192.168.10.0/24)	ICMP

3. Clear the previous firewall policies and configure the pfSense firewall to block ALL traffic from External Kali to the LAN side, except for the FTP protocol towards Windows Server 2008.

Rule #	Interface	Action	Source IP	Destination IP	Protocol (port # if applicable)
1	WAN	Pass	192.168.217.3	192.168.10.11	FTP (TCP:21)
2	WAN	Block	192.168.217.3	(ALL) 192.168.10.0/24	ALL

- Keep the firewall policies you created in Task B.3 and repeat Task A.1. What's the difference?

In this screenshot I used the command “nmap” followed by “192.168.10.0/24” as used in Task A.1, the difference is that there was no information provided about the subnet topology.
