CYSE201S JOURNAL #7 ENNIO CRUZ

All the example pictures depicted people using either a laptop or a mobile phone in different places and for different purposes.

This demonstrated that the design of the devices considered Human Systems Integration, making devices compact so that people can take them to meetings or outdoors, while being powerful and capable of doing office work and simple tasks like taking pictures

My first meme shows the technology preference of a common person. They would prefer a compact device that they can take anywhere than a device that is too heavy and can only be used plugged in an office or at home.

This relates to Human systems integrations because the development of the laptop had convenience of the user in mind. Having a device that can run on battery, small enough to carry around, and powerful enough to do the same tasks.

My second meme focuses more on human systems integration and considerations for people with disabilities. A visually impaired individual would prefer a numpad with the braille system than one without.

Human systems integration is all about considering the user in design of technology. Creating accessibility features in technology is an example of great human systems integration.
