Data breaches are a difficult thing to deal with in a lot of scenarios. Looking into Privacyrights.org it is shocking all of the data breaches that have been recent and not covered in mainstream news. Researchers looking into this information could be very useful however. Looking into how the breaches were done, who the affected, and the information gathered can help other similar companies to not get attacked. The amount of this information that is available could be used to predict further attacks. Companies scanning for malware would help substantially in preventing further attacks. Overall the data provided by these breaches can be analyzed in a way similar to the stock market. Looking into outside factors can be used to predict who will be targeted or why someone was. This information could be vital to security companies and businesses in the future.
