Looking into this article I found that bug bounty policies are a pivotal part of cyber security posturing. This adds different layers of organization behavior, risk perception, and collaborative knowledge sharing dynamics. The literature review underscores the rationale behind bug bounty initiatives. This may allude to traditional security and the way it works. There are also gaps in the research, in the empirical studies that examine the impact of bug bounty programs that should be monitored for the foreseeable future. The study does try to bridge the gaps using data sets and other techniques to analyze the determinants.
