Allocation of Budget

Employee Training

If I were to be a company's Chief Information Security Officer, I know exactly where I would allocate my budget. The first place I would allocate some of the budget is toward training employees. I would like to try to completely eliminate the possibility of human error so that it is not something we need to worry about as much. Human error is a very big factor when it comes to vulnerabilities in the cybersecurity space, so I believe prioritizing employee training would be very useful.

Security Systems

Another portion of the budget would go towards threat detection systems and threat response systems. Allocating a good amount of the budget toward these systems should be very helpful when fending against any and all cyber attacks.
