

Personal Statement

Careers paths require critical thinking of not only the future but also noting potential in the present day. By regards, this intends to adjust one's path for certainty rather than wishfulness. This was implied as I gained experience interning as a software engineer. I took in the present and formulated a plan for the future, deciding to never work an office job. All while contemplating the beneficial effects of software development. That day, I fully decided to advance my intellect through biological and chemical sciences in order to achieve a doctorate in medicine. From that day, I've taken countless steps devised to reach my greatest potential by attempting to complete my college education, joining the Virginia Beach Rescue Squad, and beginning military programs to begin the next leap in my career advancement.

Biochemical sciences intrigue even the smallest of neurons in me as I continue to learn more and more about the human body on a daily basis. Fascination and curiosity are the engines of my success as I tend to delve deep into research analysis and discussion. As I reach my junior year of university, I have completed a majority of my major requirements and can finally make out the finish line before the horizon. Although less compelling classes are required, I still advanced my knowledge and critical thinking. Regarding my latest step of progress, joining VBEMS was a massive influence toward the medical field as it has piqued my interest. Running rescue and learning first hand at how basic life support is given on a daily basis. I was fortunate enough to participate in the VBEMS academy as it was free to the public, with at least a year of volunteer work. As a buffer to my current resume, I believe volunteering for the city of Virginia Beach will put me ahead of my peers applying for similar positions. My final step is in securing a job in the future in the military. This along with my degree will be the next stepping stone I will need to achieve in order to move forward.

I believe that consistency is more rare than talent or enthusiasm, therefore I try to actively stick to good habits that better myself and keep potential raised. Breaking the procrastination curse throughout my college career has been difficult, but with a scheduled plan, I am able to break this procrastination and deal with more. This form of discipline is hard to start but gets easier to master with time. Designated time spent on working homework and projects out, which has actually freed up more time overall.

Working with EMS has given me more confidence and pushed me more into an adult/matured sense of life. Although it usually consumes my weekends as I don't have spare time during the week, it has made me a more versatile person and helped strengthen my view on the medical field. I have fun working shifts and I learn great experiences from amazing teachers. I believe I am ready for the next part of my life, but first I need to complete this stage in order to participate in the next.
