Article Review 1

Article 1: Cybercrime Challenges in Iraqi Academia: Creating Digital Awareness for Preventing Cybercrimes

This article covers how the school systems in Iraqi lack the cyber security background and how they are trying to make their school systems better for building a safe environment. This article also covers the five independent variables of cyber security: "information security, creative behavior, cybereducation, cyber training, Internet applications and one dependent variable, of digital awareness." The study included testing those variables against digital awareness and the samples for testing those variables included many schools throughout Iraq. After all the tests they figured out that using an advanced learning management system would help along with other tools to increase their cyber security awareness and a better learning system for all the students and generations to come. With Iraq doing this it might help other countries throughout the world increase their cyber security and digital awareness.

Article 2: Cyberbullying of Household Women in Iraq: A Critical View for Prohibition of

Violence

This article focuses on the cyberbullying of women trapped in the household in Iraq and how this can be very detrimental to these women. Cyberbullying around the world and in Iraq is on the rise due to social media like Facebook and Twitter, just to name a few, with people hiding behind a pen name and saying what they want. There are no consequences for these people since it is hard to enforce rules online. With the lack of resources and literacy combined with the laws being against these women, it all just adds up and something has to be done. This study tests what can happen if the government fixes the justice system to fix these cyberbully attacks and help the women that are in houses all day. This not only would help Iraq but it would also help the world too because even in the United States we have these problems as well.
