E-Establish connections throughout your career

R- Read and implement code

S-Secure Wifi networks

E-Enforce cyber security policies

C- Connect with different businesses

U-

R-Risk management

I- Implement

T- Train all employees to do other task than what they do

Y-

I am going to use the Cyber Security letter B to help build my business plan. The B in Cyber security, stands for the building of a cyber team. In building a cyber team, you want a round of different people from different backgrounds. In a business, you want more than just cyber security people working, because cyber involves a lot of different disciplines. For example, you will need somebody that will make the cyber security principles for the business. This comes into play when you have a good background of cyber professionals.

You will need professionals that will be able to work and solve various problems. By having a variety of different cyber professionals leads to networking throughout the company and possible partnering companies. If you have an IT specialist that knows people at a different company that could possibly use with and technology issues that might occur in the business. It leads to different possibilities of experts learning different information that is not particularly in their field of expertise. The goal of this business plan would be to bring together people that have so much talent in this one field and let them expand their expertise.

To start this business, probably wouldn't be much depending on who you get to work for your business. For example, you could have some senior cyber experts, and you could also have some college graduates. Of course the senior experts would have a higher pay grade than the recent college graduate. I would sustain the

business by gradually bringing on high school and college graduates to help them gain experience so they can possibly gain a secure position in the company for future use.
