Journal Entry # 6: Part 2 (Meme)

Human Systems Integration is a concept of integrating human related factors in building and designing any form of technology. The "Doggy Meme" above shows that humans might react differently online if their emotions are stirred by happiness, excitement, sadness, and even fear. In a real-life situation, a person that gets an email that contains a message about receiving free stuff might be inclined to click it based on the emotions that the person is experiencing that day. Human emotion and emotional reaction are two factors to consider when making and building technological systems, components, and regulations.
