

- Watch [this video](#) and consider how researchers might use the information shared by the former criminal to conduct cybersecurity studies .

- Is it ethical to study people in cyberspace when they don't they are being studied?

They would take what they learn from former hackers to adjust to what they find out. Applying it by making a new software or a new policy, as the former criminal he will have tons of information on how other hackers operate. Being able to conduct research on these individuals not for their skills but the mentality. Figure out the mindset on why they decided to become criminals, how it changed their goals, etc. Ethics wise it's wrong because everyone deserves to have their own privacy and people have to trust that their information is safe at all times. If it would get exposed in any way they could question trust factors with the connection. Being ethical is a big part of working in the cybersecurity field so no it is not unless under strict restrictions where it may be under a terms of use or like the earlier question if they are a former criminal. It could be a problem if they are left unwatched and could possibly do the same thing over and over again.
