

The Short Arm theory is the idea that we only know what's in the short term and have no idea of the possible threats that could appear in the future. Be able to adjust to attacks getting through and when they get through we are able to react efficiently in reactive ways. Make sure to be aware that things will be able to break into our system which will be beyond our control. Having the awareness that anything could happen to the system should be fully transparent for any employee working at the job under the policy made. Make sure we put full effort into the idea that we need to prevent and if we cant prevent to mitigate the damage done to the company. Another key idea is that we need to work together to know when something gets through the system that it's not just someone's fault and they get fired it is the team's fault and should try to capitalize on the problem to future enhance the system from future threats. Knowing that in the cyber world that penetration in a system is inevitable and not having the mindset would stop the idea that we have to control everything in the field.
