

# Seattle Seawall Flood Solution Project

By Stephen Borst

&

Ronald Giddings

It is a L shaped structure that digs into the side of the ground this uses the leverage of all the weight that is in that area and holds against the waves and erosion.

One thing that stuck out to me is the fact that it does not try to manipulate where the ocean goes. It instead works around the ocean and works with it even. Another reason I loved this design is because it helps the salmon and other fish migrate and spawn so it increases the population of species native to the area and keeps the city safe.
