Cybersecurity and Social Sciences 201S

19 April 2024

Journal 15

The video was about digital forensics and how digital investigation procedures can go. A big part of social sciences is understanding the human psychological factors involved in a situation. While digital forensics focuses a lot on the digital side of things, I think that it is heavily involved in human intervention. For example, in order for a vulnerability in a system to be taken advantage of, a human must first make a mistake for the vulnerability to take place. Social sciences can be very helpful in understanding how and why cyber-attacks happen. The way the speaker of the video got into digital forensics seemed very understanding to me. Digital forensics is something that I have found interesting and might just be a career I will pursue.
