How does cyber technology impact interactions between offenders and victims?
Arielle McGlone
November 13, 2019

I think that cyber technology impacts it great in a bad way. Since there is so much you can do with technology with it advancing greatly as we speak. Technology gives the offenders an advantage over the victims since they are committing the offense through technology. The crime may be harder track, it may take them a while to realize what's happening, and it's harder to prevent it from happening again. Committing a cybercrime, you can do it in the comfort of your own home and they not know who you are. The crimes are getting more dangerous because you can do so much and we keep a lot of personal information on computers, which makes us heavily reliant on our computers. Also, technology is making it convenient for the user by storing confidential information such as SSN's, DOB, credit card numbers, and so on. Since it is so accessible for us, we don't think the second guess how it will affect us in the long run we only have a user point of view not a criminal point of view about doing this stuff. Along with the issues that the article brought up about racism and the views leading it was right. Since also there are rising issues being brought up in America today are heavy influence on the crimes and makes a bad impact on technology and how it is used. Which also circles back to the interaction between two people and it reflects it poorly. Technology also has its positive sides with helping us out. We wouldn't know how to find these criminals if we didn't have people who use it and specialize in the cyber field. there are innovative ways that technology helps in as well. So, to speak cyber technology reflects poorly on the interaction between offenders and victims which in the end is bad for the victim.
