

The first image represents cybersecurity because humans are the center of cybersecurity. If a new technology is released and it does not have human factors in mind it will fail. This also relates to cybersecurity employee training because it is important for employees to be prioritized when it comes to organization cybersecurity. The second photo is a representation of what most of cybersecurity is like, which is just making sure systems are updated and checking them. Cybersecurity employees of course have other jobs but most of it I would say is the former. The third photo is meant to represent the amount of focus that a cybersecurity employee requires. For example a pen tester is going to be focused on finding a vulnerability in a system in multiple ways at once requiring lots of focus.
