A Lot of fraudulent sites do their best to mimic real ones by keeping the same names but they add slight changes like net or extra words. Real websites always use the same constituent URLS and secure websites. Alot of fake websites lack a https and when you do click on it they go straight to a login to create a sense of urgency which real sites do not do. With fake websites their design is usually bad and doesn't match the usual theme or design of the website they are trying to mimic. It is not hard to tell the difference between a fake or real site but if you have trouble the best option is to go to the real trusting sites home page and do everything you have to from there instead of logging in with the link you get sent.
