       This article addresses the manipulation of human behavior and social outcomes through cyber mediated warfare. In this article they state that state actors leverage technology to help influence the beliefs for algorithmic speed leading to the transformation of natural conflicts. This is called information blitzkrieg, this weakens trust in institutions and values by exploiting information flows while manipulating both information and social networks. In history there are multiple types of propaganda techniques that use tactics like bend maneuvers. There is a shift happening where human domains in warfare are being exemplified by events like the Arab spring showing the importance of understanding these threats and how to counter them.
