In the PrivacyRights.org, I noticed that there have been many breaches in the past 16-17 years. I saw that there were over 2 billion breaches across America and New York, California, Texas and Florida being the highest of these breaches. Many researchers would need to analyze the number of data breaches and which one is more common. They would need to focus on tackling the most common attack first, which is hacking. They will need to analyze the number of attacks by state and figure out the cause of why one state has more breaches than another. Researchers would also have to look at security weaknesses in organizations to help them develop measures to help them better their security.
