Journal Entry #2

To start off with the principles of science and how it is related to cybersecurity, I'm going to start off with Relativism. Relativism means that all things are related. For example, the healthcare system changed with technological advancements. The criminal system developed new ways to respond to crime using cybersecurity. All in all, almost all the new developments in the world have some relation to cybersecurity. In my opinion, the world wouldn't be where it is right now without cybersecurity and technology, obviously. That's just an example of one principle of science. But all together the principles of science relate to cybersecurity because with cybersecurity we create a better framework for each of the principles (relativism, objectivity, parsimony, ethical neutrality, and determinism)
